

ENTROPY / CPU PRESSURE VISUALIZER — CONTROLS

The field is driven by harvested machine entropy (CPU pressure + mouse velocity + frame jitter + system-time hash). You can steer and reshape it live with the mouse and keyboard.

MOUSE

move / hover gentle pull — threads drift toward the cursor
hold (press) strong pull + stir; stir force grows with how fast you move while holding
click change style — new palette + render mode, and a shockwave ring that shoves threads outward
scroll wheel zoom the noise field (texture density):
up = finer / tighter, down = broader / looser

KEYBOARD

↑ / ↓ add / remove particles (range 40–600)
← / → flow swirl — wind the field into a vortex
space pulse only — shockwave + entropy spike, with no style change
R reset swirl, zoom, and clear ripples

READOUT

The top-left panel shows live CPU state, the combined entropy score, fps, the four entropy contributions (cpu / mouse / frame / time), and the active style.

Tip: wiggle the mouse and watch the "mouse" term and the entropy bar climb; hold the machine under load to push "cpu" and "frame."
